SUMMARY

Software engineer (data & AI) who builds the integrations, data pipelines and AI automation that run a multi-brand operating company. Shipped a serverless BI platform with a 119-test suite in CI, cut a 30-minute API sync to about 40 seconds, and uses the Claude and OpenAI APIs and Claude Code daily to automate operations. Seeking AI automation, solutions and software engineering roles.

SKILLS

AI & Automation: Claude API, OpenAI API, Claude Code, Prompt Engineering, AI Automation, Process Automation, TensorFlow, Keras

Engineering & Systems: Python, SQL, JavaScript, Java, API Integration, GraphQL, GitHub Actions (CI/CD), Cloudflare Workers, pytest, Git, DNS, Google Apps Script, Quartix GPS API, HubSpot, Salesforce, Jobber API

Data & BI: ETL Pipelines, Pandas, NumPy, GeoPandas, Matplotlib, Tableau, Looker Studio, Excel, QGIS

PROFESSIONAL EXPERIENCE

Data & AI Analyst -- Luften, Brooklyn, NY November 2025 - Present

- Replaced manual reporting for 5 managers with a serverless BI platform on Cloudflare Workers, unifying Shopify, Faire, Jobber and Zoho Inventory data across 3 brands with automated daily refreshes and a weekly leadership email.
- Added live operations views to the dashboard (per-technician route progress, next-day route-plan checks, receivables aging, low-stock alerts) and a "needs attention" feed that flags problems such as checklist completion below a 90% floor.
- Built a monthly route planner that replaced hand-built routes for about 450 visits a month across 4 drivers, following business rules (one area per driver per day, 21-day spacing, driver rotation) and pushing the plan to Jobber and Google Sheets automatically; stops per route rose from 7.3 to 8.3 (+14%), and a month of about 430 stops now fits in 14 working days instead of 20.
- Integrated the Quartix GPS API to track 4 service vans: live map with next stop and ETA, off-route alerts, daily replay and recap, and payroll hours taken from van data instead of self-reported times.
- Audited revenue pipelines and fixed 5 accuracy bugs, including double-counted refunds and a nearly 2x overstatement of collected revenue; added a 119-test pytest suite in CI to prevent regressions.
- Cut the Jobber sync that tracks jobs as they complete through the day from about 30 minutes to about 40 seconds by diagnosing an API bottleneck, making same-day technician performance monitoring practical; then built a GraphQL tool that rolled a new checklist across 469 active jobs.
- Migrated Shopify ingestion from REST to the GraphQL Admin API with cursor pagination and rate-limit handling, recovering refund and customer-history data the prior pipeline never captured.
- Moved 2 production websites off Wix to Lovable (DNS, domain transfer, redirects) and fixed 2 lead forms that were silently discarding submissions; build and maintain 4 live business sites with Lovable and Claude, plus a daily blog writer for the Shopify store.
- Ran technical SEO across 5 company sites tracked in Semrush: 3 target searches reached #1 within four weeks (for example "multi unit dryer vent cleaning" from #59), Luften's search visibility more than doubled (2.0% to 4.6%), and site health scores reached 98% on two sites; also cut a sitemap from 988 to 128 URLs and gained 20+ mobile Lighthouse points on three sites.
- Built a Gmail-based outreach sender that replaced the previous email tool: 1,391 emails sent from 1,980 leads across two campaigns with zero duplicate sends, automatic bounce detection that throttles at 5%, and reply and unsubscribe tracking (12 replies, 9 sample requests).

Data Program Administrator -- Research Foundation of CUNY, New York, NY March 2024 - May 2025

- Administered Microsoft SQL Server infrastructure and ran geospatial analysis in Python (Pandas, GeoPandas, QGIS) on transportation and demographic trends across NY/NJ.

Web Developer -- Freelance, New York, NY May 2022 - Present

- Built portfolio, artist and tour websites for musicians and visual artists, and automated client reporting with Python dashboards, cutting manual reporting by 70%.

Backend Developer -- Magna Technology Group, New York, NY June 2023 - August 2023

- Built Python ETL pipelines processing 1M+ records, reducing runtime by 80% and enabling near real-time analytics.
- Built Salesforce automations with Apex and Flow Builder, increasing lead conversion by 25% and improving CRM data accuracy.

PROJECTS

- **Insights Dashboard (internal BI platform):** Serverless business-intelligence platform on Cloudflare Workers with Google-login access via Cloudflare Access, unifying Shopify, Faire, Jobber and Zoho Inventory data and orchestrated by 13 scheduled GitHub Actions/Cron pipelines. Revenue pacing, channel-split and cohort analytics with CSV export; 119 automated tests; page load cut about 38% through lazy loading.
- **The Grievance Atlas (live NYC 311 map):** Interactive map of about 3.3 million NYC 311 complaints drawn without map tiles, with density, signature and rhythm views, a live API feed, and borough-level analysis of city response times. Built in plain JavaScript.
- **Racial Bias in Facial Recognition (computer vision):** EfficientNet transfer-learning model trained on the balanced FairFace dataset (~108K images) with Grad-CAM analysis of whether equal training data produces equal accuracy across racial groups. Python, TensorFlow, Keras.

EDUCATION

Occidental College -- B.A. Computer Science, 2022. Minors: Cognitive Science, Media Arts & Culture.
